ALFRED L. FRECHETTE, M.D.
Commissioner

October 15, 1970

To the Honorable Senate and
House of Representatives

I have the honor to submit herewith, as required by Chapter III, section 2, of the General Laws, the one hundred and twenty-seventh Annual Report on statistics of births, deaths, marriages, and divorces, in Massachusetts for the calendar year 1968.

In accordance with Chapter 508, Acts of 1964, this is the fifth Annual Report of Vital Statistics published by the Department of Public Health, and is intended for administrative and research purposes connected with health programs and population studies.

The editorial review and presentation of statistical data were written by Leslie Lipworth, M.D. and Paul D. Parker, Ed.D. of the Office of Health Research. The presentation of tabular findings is restricted to utility within the meaning of the statute by authority of which the tables are prepared.

Respectfully submitted,

Alfred L. Frechette

Alfred L. Frechette, M.D.
Commissioner

THE UNIVERSITY OF CHICAGO
DEPARTMENT OF THE HISTORY OF ARTS
AND ARCHITECTURE

Dear Sir:
I have the honor to acknowledge the receipt of your letter of the 14th inst. and in reply to inform you that the same has been forwarded to the proper authorities for their consideration. I am, Sir, very respectfully,
Yours very truly,
The Curator

Enclosed for you are two copies of the report of the Committee on the Proposed Acquisition of the [illegible] by the University of Chicago. I am, Sir, very respectfully,
Yours very truly,
The Curator

I am, Sir, very respectfully,
Yours very truly,
The Curator

Very truly,
The Curator

VITAL STATISTICS

INTRODUCTION

This is the fifth annual report of Vital Statistics produced by the Office of Health Research of the Department of Public Health. These statistics represent an extension of a computer program developed for processing a data base of health information. It includes the capability of providing information on deaths due to any specific cause or causes of death, and provides tabular findings for deaths by age groups, sex, color, and marital status.

Tabulations are based primarily on resident data rather than place or occurrence of event. For historical, planning, and demographic purposes there are general reference tables where both occurrence and residence data are reported.

Requests for more detailed findings should be sent to the Office of Health Research, Department of Public Health, 170 Morton Street, Jamaica Plain, Massachusetts 02130. Telephone: Area code 617, 522-4600.

DEFINITIONS

Residence is defined as that of the deceased for a death, and that of the mother for a birth or fetal death. Residents from other states who have lived in Massachusetts for more than one year are considered residents of this state, except in those cases of deaths within resident institutions, regardless of the length of stay within the institution. Former residents of Massachusetts who have been absent more than one year are no longer considered residents of this state.

Immature birth is considered as one for which the birth weight is 2500 grams (5 pounds 8 ounces) or less, regardless of the period of gestation.

Neonatal death is considered as the death of a child occurring during the first twenty-eight days of life.

Infant death is considered as the death of a child under one year of age.

Fetal death is the death of the product of conception prior to the complete expulsion or extraction from its mother, irrespective of the duration of the pregnancy. The death is indicated by the fact that after such expulsion or extraction the fetus does not breathe or show any other evidence of life such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles. Findings in this report are for reported fetal deaths of 20 weeks gestation or more.

Underlying cause of death is defined as the disease or injury which initiated the sequence of morbid events leading directly to death, or the circumstances of the accident or violence which produced the fatal injury. The responsibility for indicating the underlying cause of death is that of the certifying physician or medical examiner.

INTERPRETATION OF DATA

Population

Massachusetts interdecile census (1965) reported a total population of 5,295,281, which does not include student and military families residing in the Commonwealth.

Resident Live Births and Fetal
Deaths by Place of Delivery -
1968

<u>Place of Delivery</u>	<u>Live Births</u>	<u>Fetal Deaths</u>
Hospital	91,583	1,072
Other and not stated	178	13
Total	91,761	1,085

In 1968 there were 91,761 resident births and 58,872 resident deaths resulting in a natural increase by residence, of 32,889 citizens in the Commonwealth. The number of resident live births was the lowest recorded in seventeen years, and continues to reflect the national trend of a declining birth rate, whereas the Massachusetts death rate remains relatively stable over the same period of time.

Resident Births and Deaths
1965 - 1968
and Last Two Census Years

Year	Births	Rate per 1,000 Population	Deaths	Rate per 1,000 Population	Natural Increase
1968	91,761	17	58,872	11	32,889
1967	94,870	18	57,465	11	37,405
1966	97,513	18	59,301	11	38,212
* 1965	100,262	19	58,853	11	41,409
** 1960	114,018	22	56,560	11	57,458

*State Census

**Federal Census

The following table summarizes the vital events reported for Massachusetts in the calendar year, 1968.

Summary Table

Recorded Events By Residence	Total	Male	Female	Unknown, or Sex Not Stated
Live Births	91,761	47,304	44,453	4
Deaths (including infant and neonatal)	58,872	31,191	27,679	2
Infant (including neonatal)	1,776	1,051	723	2
Neonatal (under 28 days)	1,395	831	562	2
*Fetal Deaths	1,085	563	514	8

* Those occurring to Massachusetts residents, while out of state, are not included.

Recorded Events by Occurrence

Marriages - 45,528

Divorces - 9,882

Resident Births:

The need for more detailed and complete birth information is essential to Public Health programs and planning. Since continued surveillance of factors contributing to infant and maternal morbidity and mortality is necessary for the reduction in fetal wastage and needless loss of life, some of the "high-risk" areas are emphasized in this report.

Operationally defined, "high-risk" mothers are those who live under adverse socioeconomic conditions, and/or out-of-wedlock, with histories of complications and/or difficulties in pregnancy. In addition, age is considered a factor for those below or above the prime child-bearing years.

Reported findings indicate that:

1. The number of recorded resident births in 1968 for Massachusetts totaled 91,761. Classified as "white" were 86,677 (94%) and "non-white" were 4,877 (5%).
2. There were 71 births reported for children age fourteen or less, and forty-six percent (46%) were classified as "non-white."
3. The reported number of out-of-wedlock births recorded in the State for 1968 was 5,578, or approximately 6% of the total resident live births.

In spite of the decline in the number of births in Massachusetts in 1968, the number of out-of-wedlock births rose from 4,936 in 1967 to 5,578 in 1968 (6% of all births.)

Deaths:

There were 58,872 resident deaths reported in 1968.

Male deaths again outnumbered female deaths, and were greater in number for every age bracket of five-year intervals through age 74.

1. The majority of all deaths (57%) occurred within the population age 70 and above.
2. Two-thirds of all deaths (68%) occurred within the population age 65 and above, and
3. Three-fourths of all deaths (76%) occurred within the population age 60 and above.

Some of the findings for resident deaths by marital status, sex, and age group were as follows:

1. There were 10,820 deaths of single individuals distributed across all age groups, of which 5,717 were male and 5,103 were female. In the "prime-marriageable" age group of 20-29, there were four times as many deaths among men (326) as women (81).
2. More than twice as many married men (18,005) died in 1968 than their counterparts of women (7,720).
3. More divorced males (1,077) died, than did divorced females (688), in 1968.
4. More than twice as many widowed females (14,133) than widowed males (6,319) expired in 1968.

Infant Mortality:

A total of 1,776 deaths of children below age one were recorded in 1968, of which 1,051 were males and 723 were females. The total exceeds the sum of male and female deaths because of data for which sex was not stated. Approximately 90% of these deaths are accounted for in the table for five leading causes of death by age group. Neonatal deaths (under 28 days) numbered 1,395, of which more than half (788) died during the first day of life, and 91% (1,263) died during the first week of life. Total resident deaths of under 28 days (neonatal) and under one year (infant) are tabulated by sex, for counties, cities, and towns.

Fetal Deaths:

As noted, fetal deaths of 20 weeks gestation or more are reported, and for 1968 there were 1,085 such deaths recorded. As in prior years fetal wastage reflects little change for 1968 in that:

1. A disproportionate number of fetal deaths occurred in the "non-white" population where the ratio of fetal deaths per 1,000 live births was 11.6 for the "white" population and 14.4 for the "non-white".
2. Proportionately, the greatest numbers of fetal deaths reported occurred in the "high-risk" mother groups, age 35 and above, and
3. In the prime child-bearing years of 20-29, the ratio of fetal deaths to 1,000 live births was 10.0 for "white" mothers and 12.2 for "non-white", reflecting a

slight decrease in the "non-white" population.

Marriages:

The number of marriages recorded in 1968 for Massachusetts totaled 45,528, or an increase of 4,181 marriages above 1967. There were 15,279 (33.6%) marriages between Massachusetts residents, and 18,048 marriages (39.6%) between a Massachusetts resident bride or groom with a non-resident partner. In addition, there were 12,201 marriages (26.8%) between non-resident brides and grooms.

1. There were 38,391 males and 38,684 females who were involved with first marriage.
2. There were 6,563 males and 6,147 females recorded for second marriages.
3. There were 518 males and 632 females married for the third time.
4. There were 56 grooms and 65 brides who had reportedly tried marriage at least four times.
5. There were twenty girls under the age of fifteen who were married.
6. There were 3,547 marriages in which both partners were teenagers, and
7. In the divorced population 5,338 males and 5,017 females were married again.

Divorces:

Divorce findings for 1968 reported:

1. There were 9,882 divorces and 111 annulments granted.
2. Fifty-nine percent (59%) of the divorces and 80% of the annulments were not contested, and
3. Approximately 37% or 3,673 divorces occurred following marriage of five years or less duration.

Recent Trends in Cancer of Certain Sites

The following section deals with trends in deaths due to cancers of certain organs in the periods 1959-1961 and 1966-1968. In all cases crude death rates per 100,000 are used to show these trends. Insufficient demographic data by age are available to calculate age-standardized figures.

Cancer of the Stomach

There had been a statistically significant decrease in the number of deaths due to cancer of the stomach in both males and females in Massachusetts as elsewhere in the United States over the two periods studied. No acceptable explanation has been put forward for this as yet.

	Deaths due to Cancer of Stomach		Avg. Annual Rate per 100,000	
	M	F	M	F
1959-61	1351	934	18.1	11.7
1966-68	1068	816	13.4	9.6

Cancer of the Cervix Uteri

The decline in the mortality due to cancer of the cervix from 1959-61 to 1966-68 is also highly significant. This may be due to extensive use of the Papanicolaou smear to diagnose these cancers in a pre-invasive stage and/or to the fact that at present upwards of 20% of women undergo removal of the entire uterus before the menopause and are thus no longer at risk of developing uterine tumors. A study carried out by the Beverly Hospital in Massachusetts and the State Department of Public Health supported the belief that the reduction of deaths due to this disease in Beverly was due to the introduction of screening by the Papanicolaou technique and to early detection of invasive growths. A questionnaire to Massachusetts laboratories in 1968 indicated that roughly 500,000 of the 1,800,000 Massachusetts adult females at risk have a Papanicolaou smear annually.

	Deaths due to Cancer of the Cervix	Avg. Annual Rate per 100,000
1959-61	631	7.9
1966-68	509	6.0

Cancer of the Bladder

Continued surveillance of this form of malignancy, which has fortunately shown no increased mortality over the two periods, is of particular importance because of its relationship to certain dyes used in industry and to cigarette smoking.

	Deaths due to Cancer of Bladder		Avg. Annual Rate per 100,000	
	M	F	M	F
1959-61	622	263	8.3	3.3
1966-68	630	287	7.9	3.4

Cancer of the Breast

In 1966-68 cancer of the breast accounted for 3.8% of all female deaths compared to 3.5% in 1959-61. An increased incidence is associated independently with low parity (no or few pregnancies) and high socio-economic class. There is limited evidence that prolonged lactation affords some protection to the mother.

The trend shown in Massachusetts is similar to that shown by the United States as a whole and is cause for concern.

	Deaths due to Cancer of Breast	Avg. Annual Rate per 100,000
1959-61	2759	34.5
1966-68	3109	36.5

Cancer of the Brain

There has been an increase over the two periods in deaths due to malignant disease of the brain. However, there has also been a compensating decrease in the tumors of the brain for which malignancy was not stated on the death certificate. Thus, the increase in cancers of the brain is merely an example of better reporting and/or more precise diagnosis. The following figures for males and females combined demonstrate this:

Deaths due to Brain Tumor (both sexes combined)

A. Malignant tumor of brain			B. Malignancy not stated		A + B	
	No.	Rate per 100,000	No.	Rate per 100,000	No.	Rate per 100,000
1959-61	681	4.4	134	0.9	815	5.3
1966-68	791	4.8	67	0.4	858	5.2

Cancer of the Pancreas

Similarly, more precise localization of the organ of origin of the cancer may also account for part of the recent increase in mortality figures for cancer of the pancreas. Many of these cancers may previously have been assigned to malignant disease of the stomach. On the other hand, this does not mean that the substantial decline in mortality from stomach cancer referred to previously can also be accounted for mainly by this change in diagnostic practice. Little is known concerning the etiology of cancer of the pancreas.

	Deaths due to cancer of Pancreas		Avg. Annual Rates per 100,000	
	M	F	M	F
1958-61	796	667	10.7	8.4
1966-68	881	824	11.1	9.7

Cancer of the Lung

The rapidly increasing mortality due to cancer of the lung in both sexes was referred to in the 1967 Public Document No. 1, as well as, the high death rates do to this disease in the City of Boston. Higher rates are the rule for large cities and may be due to differences in smoking habits or to an interaction between metropolitan air pollution and the tobacco habit.

In 1968 the numbers of deaths due to lung cancer showed a further increase from 1639 in 1967 to 1737

	Deaths due to Lung Cancer		Avg. Annual Rates per 100,000	
	M	F	M	F
1959-61	3151	551	42.2	6.9
1966-68	4120	914	51.8	10.7

Cirrhosis of The Liver

Mortality from cirrhosis of the liver has been increasing in recent years. Since this disease is, in the majority of cases, associated with over-indulgence in alcohol, the reported increase is significant for prevention. The figures presented here refer to all deaths due to cirrhosis, whether alcoholism was referred to on the death certificate or not. (ICD 581).

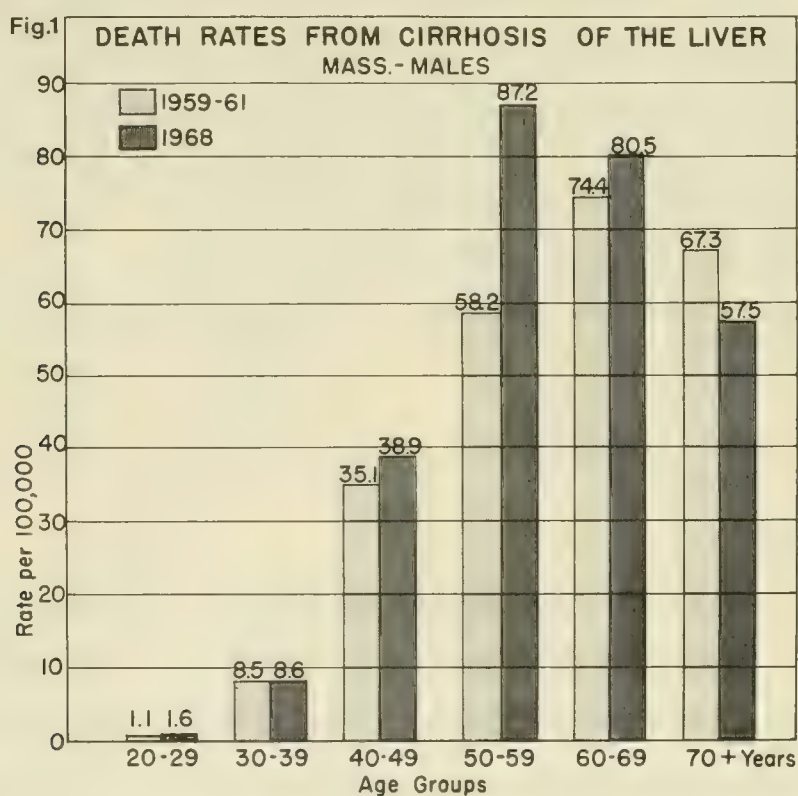

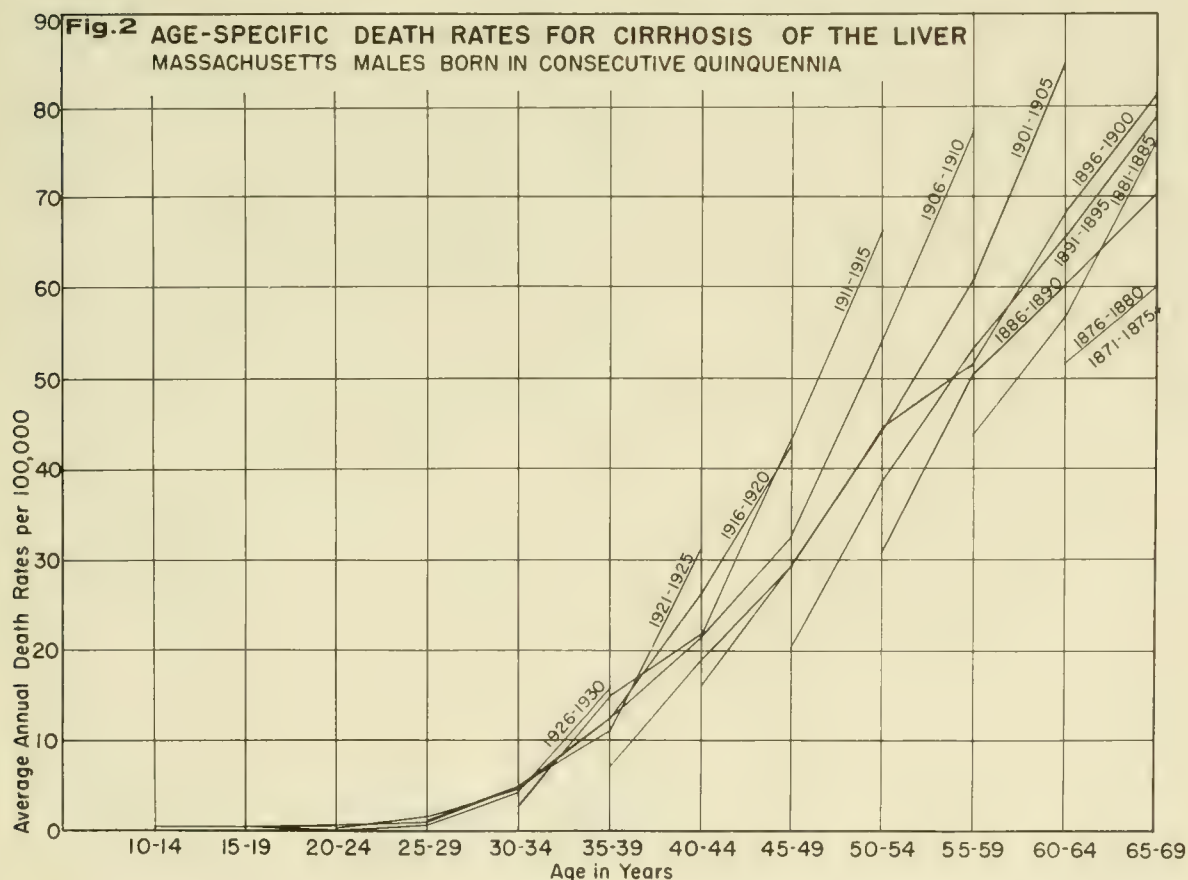

Fig. (1) shows the average annual mortality rates of men from cirrhosis in ten-year age groups in Massachusetts in 1959-61 and in 1968. The age group 50-59 years showed the greatest increase in 1968. Persons in this age group in 1968 averaged about 20 years of age when prohibition was repealed in the United States. In order to investigate this association further, a cohort analysis of

male mortality from cirrhosis was carried out. In this type of procedure, the death rates for persons belonging to the same cohort or generation are examined. Each line in Fig. (2) gives the death rates at various ages for those persons who were born in the five-year period shown at the upper end of the line. The primary advantage of this approach is in its visual presentation of the mortality of persons who were exposed to the same historical events at roughly the same age; all, however, were not necessarily affected by these events to the same extent. In the second place, it can be used to predict future trends in the mortality from diseases due to alcohol, or smoking for example, if these habits persist unabated in the future among persons in the younger cohorts (shown on the left in Fig. 2.) This can be done by simply projecting the left hand lines.

There is little evidence of the effect of the repeal of prohibition in Fig. (2). It is apparent, however, that in spite of the inconsistency shown for the group born in 1916-1920, mortality from cirrhosis of the liver is increasing in Massachusetts and will probably continue to do so over the next decade.
